Foreword

Life expectancy has significantly increased in the last century, thanks to the discovery and development of new drugs by pharmaceutical industries. Search for new therapeutics is the primary activity of the R&D of pharmaceutical industries and it involves complex network of tasks such as synthetic chemistry, *in vitro* *in vivo* efficacy, safety, preclinical and clinical research. Statistical analysis has always been the foundation to establish the safety and efficacy of drugs. The decision to- or not to- advance preclinical drug candidates to very expensive clinical development heavily relies on statistical analysis and the resulting significance of preclinical data. Recent reports attributed failure of certain drugs in clinical stages of development to improper conduct of preclinical studies and inappropriate application of statistical tools. Applying appropriate statistical tools is sagacious to analysis of data from any research activity. Though scientists expect computerized statistical packages to perform analyses of the data, he/she should be familiar with the underlying principles to choose the appropriate statistical tool.

‘A Handbook of Applied Statistics in Pharmacology’ by Katsumi Kobayashi and K. Sadasivan Pillai is a very useful book for scientists working in R&D of pharmaceuticals and contract research organizations. Most of the routine statistical tools used in pharmacology and toxicology are covered perspicuously in the book. The examples worked out in the book are from actual studies, hence do not push a reader having less or no exposure to statistics outside his/her comfort zone.

Preface

Scientists involved in pharmacology have always felt that statistics is a difficult subject to tackle. Thus they heavily rely on statisticians to analyse their experimental data. No doubt, statisticians with some scientific knowledge can analyse the data, but their interpretation of results often perplexes the scientists.

Statistics play an important role in pharmacology and related subjects like, toxicology, and drug discovery and development. Improper statistical tool selection to analyze the data obtained from studies conducted in these subjects may result in erroneous interpretation of the performance- or safety- of drugs. There have been several incidents in pharmaceutical industries, where failure of drugs in clinical trials is attributed to improper statistical analysis of the preclinical data. In pharmaceutical Research & Development settings, where a large number of new drug entities are subjected to high-throughput *in vitro* and *in vivo* studies, use of appropriate statistical tools is quintessential.

It is not prudent for the research scientists to totally depend on statisticians to interpret the findings of their hard work. Factually, scientists with basic statistical knowledge and understanding of the underlying principles of statistical tools selected for analysing the data have an advantage over others, who shy away from statistics. Underlying principle of a statistical tool does not mean that one should learn all complicated mathematical jargons. Here, the underlying principle means only 'thinking logically' or applying 'common sense'.

The authors of this book, with decades of experience in contract research organizations and pharmaceutical industries, are fully cognizant of the extent of literacy in statistics that the research scientists working in pharmacology, toxicology, and drug discovery and development would be interested to learn. This book is written with an objective to communicate statistical tools in simple language. Utmost care has been taken to avoid complicated mathematical equations, which the readers may find difficult

to assimilate. The examples used in the book are similar to those that the scientists encounter regularly in their research. The authors have provided cognitive clues for selection of an appropriate statistical tool to analyse the data obtained from the studies and also how to interpret the result of the statistical analysis.

Contents

<i>Foreword</i>	v
<i>Preface</i>	vii
1. Probability	1
Probability and Possibility	1
Probability—Examples	2
Probability Distribution	3
Cumulative Probability	3
Probability and Randomization	4
2. Distribution	6
History	6
Variable	6
Stem-and-Leaf Plot	7
Box-and-Whisker Plot	8
3. Mean, Mode, Median	11
Average and Mean	11
Mean	11
Geometric Mean	12
Harmonic Mean	12
Weighted Mean	13
Mode	13
Median	14
4. Variance, Standard Deviation, Standard Error, Coefficient of Variation	16
Variance	16
Standard Deviation (SD)	18
Standard Error (SE)	19
Coefficient of Variation (CV)	19
When to Use a Standard Deviation (SD)/Standard Error (SE)?	20

5. Analysis of Normality and Homogeneity of Variance	23
Distribution of Data in Toxicology and Pharmacology Experiments	23
Analysis of Normality	23
Tests for Analyzing Normal Distribution	24
Shapiro-Wilk's W -test	24
Power of Shapiro-Wilk's W -test	27
Parametric and Non-parametric Analyses	31
Analysis of Homogeneity of Variance	31
Bartlett's homogeneity test	31
Levene's homogeneity test	32
Power of Bartlett's and Levene's homogeneity tests	32
Do We Need to Examine the Data for Both Normality and Homogeneity?	33
Which Test to be Used for Examining Homogeneity of Variance?	33
6. Transformation of Data and Outliers	37
Transformation of Data	37
Outliers	38
Masuyama's Rejection Limit Test	40
Thompson's Rejection Test	41
Smirnov-Grubbs' Rejection Test	42
A Cautionary Note	42
7. Tests for Significant Differences	47
Null Hypothesis	47
Significant Level, Type I and Type II Errors	48
Why at 5% Significant Level?	48
How to Express P ?	50
One-sided and Two-sided Tests	50
Which Test to Use: One-sided or Two-sided?	51
8. t-Tests	56
Student's t -Test—History	56
t -Test for One Group	56
t -Test for Two Groups	57
Student's t -test	58
Aspin-Welch's t -test	60
Cochran-Cox's t -test	62
Paired t -Test	64
A Note of Caution	65

9. Correlation Analysis	67
Correlation and Association	67
Pearson's Product Moment Correlation Coefficient	68
Significance of r	69
Confidence Interval of Correlation Coefficient	70
Coefficient of Determination	71
Rank Correlation	71
Spearman's Rank Correlation	71
Canonical Correlation	72
Misuse of Correlation Analysis	72
10. Regression Analysis	74
History	74
Linear Regression Analysis	74
Confidence Limits for Slope	78
Comparison of Two Regression Coefficients	79
R^2	80
Multiple Linear Regression Analysis	80
Polynomial Regression	81
Misuse of Regression Analysis	82
11. Multivariate Analysis	84
Analysis of More than Two Groups	84
One-way ANOVA	85
<i>post hoc</i> Comparison	87
Dunnett's multiple comparison test	87
Tukey's multiple range test	89
Williams's test	90
Duncan's multiple range test	95
Scheffé's multiple comparison test	98
Two-way ANOVA	100
Dunnett's Multiple Comparison Test and Student's t Test—A Comparison	103
12. Non-Parametric Tests	106
Non-parametric and Parametric Tests—Assumptions	106
Sign Tests	106
Calculation procedure of sign test for small sample size	107
Calculation procedure of sign test for large sample size	107

Signed Rank Sum Tests	109
Wilcoxon rank-sum test	109
Fisher's exact test	111
Mann-Whitney's <i>U</i> test	113
Kruskal-Wallis Nonparametric ANOVA by Ranks	117
Comparison of Group Means	119
Dunn's multiple comparison test for more than three groups	120
Steel's multiple comparison test for more than three groups	121
Rank Sum Tests—Some Points	123
13. Cluster Analysis	127
What is Cluster Analysis?	127
Hierarchical cluster analysis	127
Ward's method of cluster analysis	128
<i>k</i> -means cluster analysis	129
14. Trend Tests	136
Introduction	136
Jonckheere's trend test	136
The Cochran-Armitage test	139
15. Survival Analysis	143
Introduction	143
Hazard Rate	144
Kaplan-Meier Method	144
Kaplan-Meier product-limit estimator	144
16. Dose Response Relationships	150
Dose and Dosage	150
Margin of Exposure, NOAEL, NOEL	150
Determining NOEL and NOAEL	152
Benchmark Dose	153
Probit Analysis	154
IC ₅₀ and EC ₅₀ Determination	157
Hormesis	158
17. Analysis of Pathology Data	163
Pathology in Toxicology	163
Analysis of Pathology Data of Carcinogenicity Studies	164
Peto test	165
Decision rules	166

Poly- <i>k</i> Type test	167
Analysis of Tumour Incidence—Comparison with Historical Control Data	168
Analysis of Incidence of Tumour Using X^2 Test	170
Comparison of Incidence of Tumours in Human, Rats, Mice and Dogs	170
Analysis of Organ Weight Data	172
Interpretation of Pathology Observations	173
18. Designing An Animal Experiment in Pharmacology and Toxicology—Randomization, Determining Sample Size	178
Designing Animal Experiments	178
Acclimation	179
Randomization	179
Determining Sample Size	183
Animal Experimental Designs	185
19. How to Select An Appropriate Statistical Tool?	188
Good Statistical Design	188
Decision Trees	188
Statistical Procedures Used by National Toxicology Program (NTP), USA	191
Decision Tree Produced by OECD	193
Incongruence in Selection of a Statistical Tool	194
Selection of a Statistical Tool—Suggested Decision Trees or Flow Charts	195
Statistical Tools Suggested for the Analysis of Toxicology Data	196
Use of Statistics in Toxicology-Limitations	196
Appendices	201
Appendix 1. Coefficient for Shapiro-Wilk <i>W</i> Test	202
Appendix 2. Quantiles of the Shapiro-Wilk Test Statistic	206
Appendix 3. Z Score for Normal Distribution	208
Index	211
