1	Questioning Chance	1
1.1	Introduction	1
1.2	Different Uses of the Word “Chance” in the Sciences	3
1.2.1	Chance in Quantum Mechanics and Mechanical Statistics	4
1.2.2	Chance for the Statistician	6
1.2.3	Chance for the Probability Theorist	7
1.2.4	Chance for the Numerical Analyst and the Computer Scientist	8
1.2.5	Chance, Hazards, and Risks	10
1.2.6	Life Tested by the Vagaries of the Environment During Its Long History	11
2	Chance in Living Systems	15
2.1	Chance and Necessity	15
2.1.1	The Neutral Theory of Evolution: A Gentle Necessity	16
2.1.2	The Couple Chance-Necessity	17
2.1.3	Randomness and Evolution: The Necessity of Chance	18
2.1.4	From the Gene to the Ecosystem: Chance in the Different Organisational Levels of Living Systems	18
2.2	Known Genetic Diversification Mechanisms	19
2.2.1	Gene Diversification: The Randomness of One-Off Mutations	19
2.2.2	The Organisation and Plasticity of the Genome: The Vagaries of Piecewise Mutations	22
2.2.3	Reproduction and the Transmission of Genetic Information: Shuffling the Cards	27
2.3	The Cell and the Organism: A Limited Randomness	31
2.3.1	A Living Machine	31
2.3.2	Individual Homogeneity, the Diversity of Organisms	31

2.3.3	A Cooperative Structure	33
2.3.4	A Limited, But Efficient Randomness: The Immune and Olfactory Systems	35
2.3.5	Using the Vagaries of the Environment	37
2.3.6	Organisms and Changes in the Environment	37
2.3.7	Random Behaviours	37
2.4	Lineages, Populations and Species: Chance Encounters, Couplings, and Disturbances	39
2.5	The Main Sources of Biodiversity	42
2.6	Evolution and Its Theories: The Randomness of Genetic Modifications	43
2.7	Ecological Randomness: Live and Survive Together, Face Environmental Risks	46
2.7.1	The Neutral Theory of Biodiversity	49
2.7.2	Spatial Distribution: Randomness and Necessity in the Environment	50
2.7.3	Evolutional Interpretation in the Face of Risks: Necessary Diversification and the no Less Necessary Random Distribution	51
2.7.4	The Dynamics of Biodiversity	59
2.7.5	Measuring Biodiversity	63
2.8	Randomness, Chaos and Complexity	66
2.8.1	From Chaos to Randomness	67
2.8.2	Intermittences	69
2.8.3	Two Types of Randomness, Two Complexities	69
2.9	Randomness and the Organisational Levels of Living Systems	71
2.10	Conclusion	75
3	Lessons for Managing Living Systems	79
3.1	Organisms	79
3.2	Populations and Ecosystems	80
3.3	Biodiversity	81
3.4	Information and Genetic Heritage	82
3.5	Conserving Genetic Resources	82
3.6	Genetic Modification: Hybridisation and Selection	82
3.7	Genetic Manipulation: Gene Insertion	84
3.8	Cloning	85
3.9	Active Molecules of Biological Origin	86
3.10	Ecotoxicology	87
3.11	The Limits and Consequences of Mankind's Intervention on Living Systems	88
3.12	Bio-inspired and Bio-mimetic Technologies	89

4 The Contribution of Models and Modelling: Some Examples	91
4.1 Genetics and Calculating Probability: Elementary Laws and Evolution During the Genetic Constitution of a Population . .	92
4.1.1 The Mendelian Model	92
4.1.2 Genetic Evolution of an Autogamous Population	93
4.2 From Chaos to Randomness: Biological Roulettes – An Example from the Discrete-Time Logistic Model	96
4.2.1 Discrete-Time Logistic Model	96
4.2.2 Analysis of the Simultaneous Dynamics of Two Populations	99
4.2.3 From the Erratic to the Regular: The Effect of Pairing . . .	100
4.2.4 From Chaos to Randomness	101
4.3 The Continuous-Time Logistic Model and the Evolution of Biodiversity	103
4.4 Towards a General Schema for Modelling Living Systems and Their Diversities	110
5 Biodiversity and Ecological Theories	113
5.1 The Niche Theory	115
5.2 Niches and the Logistic Model	117
5.3 The Neutral Theory of Biodiversity	118
5.4 Can We Reconcile the Two Approaches?	120
5.5 A Set of Processes to Explain the Spatial Distribution of Individuals in Diversified Systems by Species	121
5.6 Chance at the Heart of Natural Ecosystems?	123
6 Chance and Evolution	127
6.1 Evolution . . . But It's Very Simple	128
6.2 And Chance in All of That?	129
6.3 “Biological Roulettes”: Products and Engines of Evolution	133
6.4 Chance, Complexity and Biodiversity	134
6.5 Evolution and the Self-organisation of Living Systems and . . . Others	137
7 Evaluating Biodiversity: The Example of French Guiana	139
7.1 A Large Diversity	139
7.2 Species Diversity and Its Evaluation: Data, Certainties and Uncertainties	140
7.2.1 The First Problem: Classification and Botanical Practices	141
7.2.2 The Second Problem: Field Access and the Field Itself	141
7.2.3 The Third Problem: Forestry and Ecological Data	142
7.2.4 Evaluation: A Draft Solution Using a Simple Model	144
7.2.5 Conclusion	146
7.3 Biodiversity on a Large, Physical Scale	146

7.4	Multi-scale and Multi-level Observations: From the Gene to the Ecosystem	146
7.5	A Very Favourable Terrain for Research on Biodiversity and its Dynamics	148
8	Conclusion	153
8.1	Living Things: Deterministic or Stochastic Machines?	153
8.2	Chance and Evolution	154
8.3	Chance is Everywhere in Biological Systems	155
8.4	Internal Processes Generating Random Events	155
8.5	Some Experiments and Much Observation	157
8.6	The Beginning of New Ways of Conducting Research?	159
	Glossary	161
